No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Patent No. 6812339

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;
CURRENT FILING DATE: 2000-04-14

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8 8
                                                                                                                                                                                                         GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

APPLICANT: Keith Weinstock et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.132

CURRENT APPLICATION NUMBER: US /09/248,796A

CURRENT PILING DATE: 1999-02-12

PRIOR APPLICATION NUMBER: US 60/074,725

PRIOR APPLICATION NUMBER: US 60/096,409

PRIOR PILING DATE: 1998-08-13

PRIOR FILING DATE: 1998-08-13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 15854, Application US/09949016

/note="forgan: Shoot apex; Vector: Uni-Zap XR; Site 1:
ECORI; Site 2: Xhoi; This library was constructed by Xiaolan Zhang. Vegetative Shoot Apical Meristem (SAM) and leaf primordia staged Pl-P4 from 14-17 day-after germination seedlings were quickly dissected into dry ice under a light microscope. Total RNA was isolated using Trizol and mRNA was purified with Dynal Oligo-DT25.
ds-CDNA molecules were generated as follows. First-strand CDNA was prepared from oligo-dT selected mRNA by priming with an XhoI oligo-dT primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 (bases 1 to 692)

```
The resulting DNA: NAW hybrid was treated with RNase H and used as a template for DNA Poll-catalyzed second strand used as a template for DNA Poll-catalyzed second strand synthesis. After the addition of Econl adaptors, the establishment of Econl adaptors, the establishment of Econlary adaptors, the establishment of Econlary specked to be 5600 bp. The resulting molecules were directionally cloned into the Econland Khol sites of the Uni-Zap KR vector. The lambda library was packaged with Gigapack III Gold packaging extract and was mass excised by XLI-Blue cells and ExAssist helper phage. Excised phagemids were titered in Solk cells and plated onto LB-ampicillin agar plates. Base calling was conducted using Phred. Trimming was performed using Lucy with the following criteria: ("minimum 200 -error 0.01 0.01 -bracket 10 0.01). A low complexity filter was applied and additional trimming was conducted to remove E. Coli, vector, and organalle contamination. After processing ~30% of the sequences contained a minimum of 10 Ts at the beginning of the clones in this library lack an Xhol site at their 3, ends."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          299 AGCCGGCTTTATGTGCCTAGAAACTAGTAGCTAGTGTTTGCTGCTGCTGTGAATGACACTAT 240

/note="Samples were collected in Robert E. Sharp's lab
(University of Missouri-Columbia) to construct three
(University of Missouri-Columbia) to construct three
normalized cDNA libraries. Dark-grown maize seedlings with
primary roots 12-20 mm in length were transplanted to high
(-0.03 MPa) or low water potential (-1.6 MPa) vermiculite,
and harvested at 5 h and 48 h after transplanting. About
1,000 roots were used for each of the low water potential
libraries (armrws05 and armws48) while 500 roots were
combined from each of the two time points at high water
potential (zmrww00). Each root was divided into 4 segments
ethylene production. Plant Physiology (Rockville). 122(3). March, 2000. 967-976. TAG TISSUB-ROot_segment_2 TAG_EEQ-ACCGA"

was converted to double-stranded characteries by using modified Oligo(dT) primers. One of 4 sequence tags corresponding to a different esgment of the root was added to the 3'-end of the modified Oligo(dT) primers, including a Nor1 site and used to reverse transcribe the segment-specific maNABs into cDAAs. Each library contains all four tags. A suffix (si. 52, s3, or 4) the sequence was found in based on the identifiest to designate which region of the root (Root_segment_1, 2, or 4) the sequence was found in based on the identifiest to designate which region of the root (Root_segment_1, 2, or 4) the sequence was found in based on the identifiest of the tag. A suffix of s0 indicates that the sequence tag, and hence the stranded cDNAs were slaze-selected (1450 bp). Size selected cDNAs were adaptored with EcoRI adaptors at both ends, and then digested with Not1. The cDNAs was directionally cloned into EcoRI-Not1 digested pBS II SK(+) phagemid vector (Stratagaene) and electroporated into E.coll in the total number of white colony forming units (cfu) in the primary libraries before amplification was as follows: zmrw905: 3.37 x 106; zmrw408: 4.87 x 106; zmrw900: 3 x 106. The background of empty clones was less than 1%. Inserts ranged from -0.5kb to >2.5 kb, as determined by RPCR. Plasmid DNA from the primary libraries then was converted to single-stranded circles and used as a fellows; representing the entire CDNA population cloned in each library, were used as a driver for normalization. Hybridized DNA rendered partially double-stranded and electroporated into DH10B. The total number of clones with insert was zarried out for 4 hours as 130c.

Non-hybridized DNA rendered partially double-stranded and electroporated into DH10B. The total number of clones was less than 1%. Insert was zarried out for 4 hours as 130c.

Insert size, determined by RPC of the entire library, ranged from 0.5kb to 2.5kb (1) Sharp R B; Silk W K; Haiao T C Growth of the Maize Primary Root elongation at low water potentials By restricting ethylen (distances are from the junction of the root apex and root cap): segment 1, 0-3 mm plus the root cap; segment 2, 3-7 mm; segment 4, 12-20 mm. (For detarils of conditions see [1] with nutrient modifications as in of conditions see [1] with nutrient modifications as in of the lab of Hans Bohnert (University of Illinois-UC). Total RNA was extracted by the 'hot Phenol' method (Plant Molecular Biology manual. D5: 1-13, 2nd ed., 1997). This method worked in eliminating carbohydrate material present in the root tips. The integrity of the RNA was verified by denaturing agarose gels and spectrophotometry (ratio A260/280). Poly(A)+mRNA was isolated twice from total RNA using the Oligotex Direct mRNA kit (Qiagen). Poly(A)+mRNA was sconverted to double-stranded cDNA and tagged by using 289 AGCCGGCTTTATGTGCCTAGAAACTAGTAGCTAGTGTTTGCTGCTGTCGAATGACTAT 230 61 GCAATGTGATCTGGAACCTGGTTTCTTGGGTGCGACGCTAGTTATGACTGTCGTCAGTAA 120 229 GCAATGTGATCTGGAACCTGGTTTCTTGGGTGCGACGCTTGTTATGACTGTCGTCAGTAA 170 9 1 AGCCGGCTTTATGTGCGTAGAACTAGTAGCTAGTGTTTGCTGCTGTCGAATGACACTAT Gaps ö 6; Length 675; Score 285.8; DB 6; Length 6 Pred. Interary was prepared by George Rudenko using poly (A) espected RNA and Universal Riboclone CDNA Synthesis System (Promesa). CDNA was synthesized using both random and oligo (dT) primers in separate reactions and equipped with EcoRl adaptors. Library was size-fractionated on agarces gels (for insert size >400bp) and non-directionally cloned into EcoRl-digested pully vector. Blue/white selection on carbenicillin-containing plates was used to recover
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BM895191 313 bp mRNA linear BST 11-MAR-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Jibrary was prepared by George Rudenko using poly (A) albrary was prepared by George Rudenko using poly (A) selected RNA and Universal Riboclone CDNA Synthesis System (Promega). CDNA was synthesized using both random and oligo(dT) primers in separate reactions and equipped with ECORI adaptors. Library was size-fractionated on agarose gels (for insert size >400bp) and non-directionally cloned into ECORI-digested pUC19 vector. Blue/white selection on positive clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Inbrary was prepared by George Rudenko using poly (A) learner RNA and Universal Ribocione CDNA Synthesis System elected RNA and Universal Ribocione CDNA Synthesis System (Promega). CDNA was synthesized using both random and oligo (AT) primers in separate reactions and equipped with EcoRI adaptors. Library was size-fractionated on agarose gels (for insert size >400bp) and non-directionally cloned into EcoRI-dispeated pUCI9 vector. Blue/white salection on carbenicillin-containing plates was used to recover
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BQ163007

/note="organ: embryo; Vector: pBluescript SK; Site 1:
XhoI; Site 2: EcoRI; Library was prepared by Statagene
using the Uni-ZAP XR system (Stratagene BN93728-12).
Clones were picked by bob after blue/white selection
(ampicillin resistance - use 100 micrograms/microliter).
Developed from a pool of equal amounts of RNA from
developing embryos sampled at 14, 21, 28 and 35 days after
pollination of the Illinois High Oil Maize Strain Cycle
90. This closed strain has been selected for high oil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EST 24-APR-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                       Inbrary was prepared by George Rudenko using poly (A) easlected RNA and Universal Riboclone cDNA Synthesis System (Promega). cDNA was synthesized using both random and oligo(dT) primers in separate reactions and equipped with EcoRI adaptors. Library was size-fractionated on agarose gels (for insert size >400bp) and non-directionally cloned into EcoRI-digested pUC19 vector. Blue/white selection on positive clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      461 bp mRNA linear EST 06-MAR-2000 stages of anther and pollen Zea mays cDNA,

Sequence 177958, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VEWTER, J. Craig et al.

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

TILE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

TILE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

CURRENT APPLICATION NUMBER: 05/949,016

PRIOR PELICATION NUMBER: 60/241,755

PRIOR PELICATION NUMBER: 60/237,768

PRIOR PELING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

Sequence 113153, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;
FILE REFERENCE: CLOOL3197

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT PILING DATE: 2000-04-14

PRIOR PILING DATE: 2000-10-20

PRIOR PLING DATE: 2000-10-30

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-06

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Fublication No. US20040181048A1
GENERAL INFORMATION:
APPLICANT: Wang, David G.
TITLE OF INVENTION: Identification and Mapping of Single
TITLE OF INVENTION: Identification and Mapping of Single
TITLE OF INVENTION: Nucleotide Polymorphisms in the Human Genome
FILE REPERENCE: 108827.135
CURRENT APPLICATION NUMBER: US/09/925,065A
CURRENT FILING DATE: 2001-08-08
FRIOR FILING DATE: 2000-10-24
FRIOR FILING DATE: 2000-11-20
FRIOR APPLICATION NUMBER: US 60/250,092
FRIOR APPLICATION NUMBER: US 60/261,766
